

Customer Shopping Behavior Analysis

Business Problem Statement

A retail company aims to gain deeper insights into customer shopping behavior to enhance sales performance, improve customer satisfaction, and drive long-term loyalty. The business has observed variations in purchasing patterns across different customer demographics, product categories, and sales channels (online vs. offline).

The company seeks to understand the key factors influencing customer decisions—such as discounts, product reviews, seasonal trends, and payment preferences—and how these factors impact purchase frequency and repeat buying behavior.

Key Business Question: How can the company leverage customer shopping data to identify trends, enhance customer engagement, and optimize marketing and product strategies?

Project Deliverables

1. Data Preparation & Modeling (Python): Clean and transform raw data for analysis.
2. Data Analysis (SQL): Extract insights on customer segments, purchasing behavior, and trends.
3. Visualization (Power BI): Build dashboards to present key insights.
4. Reporting & Presentation: Summarize findings and business recommendations.
5. GitHub Repository: Organize all project files in a structured format.

Conclusion

This project demonstrates how data analytics techniques can be applied to transform raw customer data into actionable business insights, enabling better decision-making and improved business performance.
